**date -> metric -> signal -> meaning -> direction**

## Opening signal

We do not read the future. We read the moment.

A calendar tells us when something happens. Frey asks a deeper public-safe question: what state is the moment in?

## Date is an entry

A date becomes meaningful only when we understand what question is being asked through it.

Today's date asks about the current day. A personal date opens a longer pattern. An event date opens the character of a launch, meeting, decision, or project. Two dates open a transition.

## What is a time metric?

A time metric is a structured description of a moment. It does not say what will certainly happen. It reveals the field of the moment.

- `phase_density` shows how concentrated the temporal pattern is.
- `harmonic_tension` shows pressure, friction, and required precision.
- `resonance_level` shows how strongly the moment responds.
- `eclipse_proximity` shows sensitivity to amplification.
- `structural_stability` shows whether the moment can hold form under pressure.

## From metric to meaning

---

Numbers alone are not a reading. A person lives inside state, choice, conversation, project, fatigue, intention, and transition.

Frey translates the metric into signal, meaning, and direction.

## How to read a Frey response

State names the configuration of the field. Meaning explains the pattern. Direction gives a careful vector of action or attention.

Direction must never be separated from State and Meaning.

## Practical use

If density and tension are high, reduce parallel movement and choose one central node.

If resonance is high but stability is medium, the moment may be strong but needs a precise form.

If amplification sensitivity rises, it may be better to observe where the process is changing direction rather than force a conclusion.

## Compare / Delta

One date shows a state. Two dates show a delta.

Delta reveals where pressure rises or falls, where resonance shifts, where stability changes, and where the flow moves.

## Different dates ask different questions

- Personal date: base pattern and longer line.
- Day date: quality of the current day.
- Event date: character of a launch, meeting, or decision.
- Compare / Delta: how the field changes between two states.

---

## AI Read Protocol

Do not ask an AI to make a horoscope or predict the future from a Frey output.

Ask it to read the metric as a structured state: connect the indicators, avoid certainty amplification, and return state, pattern, meaning, direction, and limits of interpretation.

## Route

/frey -> /reading -> /access

The route separates the layers: quick temporal input, meaning layer, reviewed deeper entry.

## Boundary

BHRIGU / Frey is not financial, medical, legal, trading, or deterministic life advice.

The final formula is simple: not future as a promise; the moment as structure.
